

# Climate Action Simulation: Developed Nations

**To:** Chief Negotiators for Developed Nations  
(USA, Canada, European Union, UK, Japan, Russia  
and other former Soviet Republics, South Korea,  
Australia, New Zealand)

**Subject:** Preparation for the Climate Action Summit

Welcome to the Climate Action Summit. You and leaders from all relevant stakeholders have been invited by the UN Secretary-General to work together to successfully address climate change. In the invitation, the Secretary-General [noted](#) that: “The climate emergency is a race we are losing, but it is a race we can win...The best science...tells us that any temperature rise above 1.5°C will lead to major and irreversible damage to the ecosystems that support us...But science also tells us it is not too late. We can do it...But it will require fundamental transformations in all aspects of society—how we grow food, use land, fuel our transport and power our economies...By acting together, we will leave no one behind.”

The goal of the summit is to create a plan to limit global warming to less than 2°C [3.6°F] above pre-industrial levels and to strive for 1.5°C [2.7°F], the international targets formally recognized in the Paris Climate Agreement. The [scientific evidence](#) is clear: warming above this limit will yield catastrophic and irreversible impacts threatening the health, prosperity, and lives of people in all nations.

You represent the world’s most developed nations (listed above). The combined population of your nations makes up about 17% of the global population, generates about 60% of world economic output, and has the highest GDP (Gross Domestic Product) per capita.

Your policy priorities are listed below. You can, however, propose, or block, any available policy.

- 1. Subsidize renewable energy (e.g., solar, wind, geothermal, hydropower, and storage).** The renewable energy industry is growing rapidly, but still makes up a small fraction of the world’s energy supply. Subsidies will help these industries grow, generating jobs in your nations (especially if you can outpace wind, solar, and battery technology development in China and other developing nations). Storage (e.g., batteries, thermal storage, pumped hydro) and “smart grid” technology allow variable renewables like wind and solar to be integrated into the energy system while providing round-the-clock electric power.
- 2. Reduce deforestation.** Global deforestation mostly arises in the tropical forests of developing nations, including the Amazon basin, Africa, and South/Southeast Asia. Protecting forests can reduce those emissions while also preserving biodiversity and protecting water supplies.
- 3. Consider afforestation.** Afforestation is the growth of new forests on land that doesn’t have trees; sometimes this is land that was previously deforested or degraded. As trees grow, CO<sub>2</sub> is sequestered from the atmosphere and stored in biomass and soils. If implemented on a large scale, afforestation could use land that is needed for crops or livestock, thereby increasing food prices. Consider how much land the afforestation policies you and other groups propose would require.
- 4. Reduce emissions of methane, nitrous oxide, and other greenhouse gases.** CO<sub>2</sub> is the most prominent greenhouse gas, but other greenhouse gases currently contribute to about a quarter of emissions. These include methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), and a wide range of chlorofluorocarbons and other fluorinated compounds (so-called F-gases). Molecule for

molecule, many of the non-CO<sub>2</sub> gases contribute tens, hundreds or even thousands of times more to global warming over the next century than CO<sub>2</sub>. Although their concentrations are low, they are growing rapidly.

5. **Decide whether to invest in research and development (R&D) for a new low-cost zero-carbon energy source.** Some scientists believe a new type of nuclear energy, such as thorium fission or nuclear fusion, would offer the best energy source for replacing fossil fuels, arguing that such technologies could provide low-cost, zero-carbon electricity at scale. Several prominent universities and companies are exploring promising new nuclear energy solutions. However, these new technologies are currently unavailable and would require substantial investment to become commercially viable.
6. **Decide whether significant developments can be made in carbon removal technology.** The emerging field of carbon dioxide removal (CDR) technology seeks methods to remove CO<sub>2</sub> already in the atmosphere. These technologies range from changes in agricultural practices that might be implemented today, to speculative and unproven technologies like Direct Air Capture (DAC). Your group may decide to invest in these technologies.
7. **Consider putting a price on CO<sub>2</sub> emissions.** Fossil fuels still dominate the world energy system, and the CO<sub>2</sub> they emit is by far the biggest source of GHG emissions. Economists agree that a carbon price is the best way to reduce global greenhouse gas (GHG) emissions. Consider putting a price on carbon, perhaps phased in over time to give industry and consumers time to adjust. The revenues can be rebated to the public, help offset the costs of other policies, cut your fiscal deficits, or provide aid to help developing nations cut their emissions. Although carbon prices have been implemented in some of your countries, states, and provinces, most are far lower than the \$30-50 per ton of CO<sub>2</sub>, or more, many economists recommend. The fossil fuel industry opposes carbon prices, as do companies heavily reliant on fossil fuels.

### **Additional Considerations**

You recognize that climate change is real, caused primarily by the burning of fossil fuels, and that it poses grave risks to people around the world—including your own. Climate change is a serious threat multiplier undermining your national security, as the damage from climate change increasingly drives conflict and migration, which is already causing backlash among some and the imposition of anti-immigrant policies.

At the same time, your nations depend on fossil fuels—your nations are responsible for about 36% of global greenhouse gas (GHG) emissions today, and a much higher fraction of cumulative emissions since the industrial revolution. The economies of some nations in your group rely on income from significant exports of coal, oil, and gas. At the same time, many governments and businesses are finding climate-friendly policies are good for the economy. Energy efficiency, and renewables like wind and solar, are often profitable, create jobs, and improve public health.

While your nations are striving to reduce your own GHG emissions, you note that China is the world's largest emitter (28% of global emissions), and the developing and rapidly emerging nations collectively emit about 65% of global emissions, even though emissions per person in those nations are low.
